**MIDNIGHT READER LAMP**

Customers have called our Midnight Reader the finest lamp ever made for reading in bed. It focuses just the right amount of crisp, white halogen light for one person to read comfortably while the other can sleep blissfully, unaffected by stray light. It has a special internal reflector surrounding a conventional small halogen bulb. The light of the bulb is reflected by a thin layer of aluminum making the light remarkably even. The light then passes through a frosted glass lens that filters UV rays and evens out the light further. You can control this light source in two ways—a full-range dimmer knob and a telescoping shade that focuses the light where you need it.

**TO REPLACE THE BULB**

1. **Removing the shade**

   Unplug the lamp and let it cool for at least 15 minutes. Twist the shade clockwise until it stops. Using the allen wrench loosen, but do not remove, the stopper screw beneath the shade. Remove the shade assembly from the lamp.
TO REPLACE THE BULB (CONTINUED)

2 Replacing the bulb
Replace with a 20 watt 2-pin halogen bulb. Pull out the old bulb while holding the black rubber grommet. When inserting the new bulb, take care not to touch the bulb with your fingers—hold the bulb with a piece of cloth while inserting it into the grommet. The oil from your fingertips may shorten the life of the bulb.

3 Replacing the shade
Slide the shade over the bulb until it rests at the base of the lamp housing. Slowly turn the shade until the allen screw hole lines up with the groove in the neck. Tighten the allen screw so that the shade will not slide off the housing. Turn the shade counter-clockwise to be sure it is seated correctly. If the shade twists past the stopper screw, slide the shade back to the base of the housing and line the screw with the groove again. Repeat until the shade does not twist past the stopper screw.

TO FOCUS THE BULB

4 For diffused light
Turn the shade in a counter-clockwise direction. The shade and lamp face will move away from the surface being lit to cast a wider beam of light.

Special note on focusing: When focusing the light, be sure to grasp the front of the head, and not the rear near the heat vents. The back of the lamp head will get hot when used for prolong periods of time.

5 For concentrated light
Turn the shade in a clockwise direction to move the shade toward the surface being lit.

FLOOR LAMP DIRECTIONS

6 Attaching the dimmer
To attach the dimmer on the floor lamp, loosen the allen bolt inside the base switch. Slide the dimmer wand through the collar on the neck of the lamp and into the base switch. Tighten the bolt inside the base switch with the allen wrench. Turn the dimmer wand to be sure it is seated correctly.
